

What Happens when Uric Acid Increases?

When **uric acid** increases in your blood there is a likelihood that there will be sufficient in order to allow for some of it to make into **uric acid** of urate which will negotiate in the important joints, tendons and surrounding tissue.

These microscopic crystals are 'needle-like' in shape and can thus cause inflammation, swelling, redness, stiffness, and excruciating pain in the offending joint. These are the typical the signs of **gout**.

But what Causes Uric Acid Increases in the Initial Place?

Well, normally, your kidneys process the uric acid naturally produced in your body and also excrete the excess out of your system. Unfortunately, if your kidneys are not functioning at full capacity, or, if your body's producing much too much uric acid for your kidneys to deal with, your uric acid increases and you end up with excess or high uric acid.

How is Uric Acid Produced in the Body then?

Uric acid is truly a resultant effect of a mans own metabolizing process. Chemical compounds known as 'purines' are a part of this process, and once they break down during it, uric acid is made.

- But, this is the thing: As well as **purines** naturally present in your body, they also exist in your food.
- That's why you need to closely keep track of your daily diet if you're a gout sufferer.
- You need to avoid foods that are high in purines.

Other things you can do is to prevent uric acid increases are to use **natural gout remedies** to help reduce inflammation, relieve pain, and, to lower **uric acid levels** in your blood.
